Consumer price index (CPI) December 2017

Average annual inflation in 2017 was 2.4%

Monthly inflation measured by Consumer price index was -0.2% in December 2017, while the annual inflation was 1.9%. This was influenced mostly by decrease in prices of: vegetables; meat; garments; shoes and other footwear; milk, cheese and eggs; fruit; furniture and furnishings. Growth rate of consumer prices in period January-December 2017 compared with the same period of previous year was 2.4%.

Observing the main groups monthly drop of prices was noticed in the following groups: Clothing and footwear (-1.4%); Food and non-alcoholic beverages (-0.5%); Furnishing, household equipment and routine household maintenance (-0.2%); Recreation and culture (-0.1%), while a growth of prices was recorded in the following groups: Restaurants and hotels (0.4%); Alcoholic beverages and tobacco (0.2%); Housing, water, electricity, gas and other fuels (0.2%). Prices of other products and services in the following groups: Health; Transport; Communication; Education; Miscellaneous goods and service, mostly remained unchanged.

Positive annual inflation rates in December 2017 were observed in the following groups: Alcoholic beverages and tobacco (14.8%); Transport (6.4%); Restaurants and hotels (5.4%); Clothing and footwear (3.8%); Miscellaneous goods and service (1.9%); Housing, water, electricity, gas and other fuels (0.7%); Health (0.6%); Communication (0.2%), while negative annual inflation rates were observed in the following groups: Recreation and culture (-0.8%); Furnishing, household equipment and routine household maintenance (-0.7%); Food and non-alcoholic beverages (-0.1%).

0112	Meat	93.8	-0.9	-0.09

METODOLOGICAL NOTES

Consumer price indices (CPI) are one of the most important macroeconomic indicators and the basis for taking decisions in the area of economy and finance. Since January 2009 they are used as *official measure of inflation* in Montenegro.

Consumer price index is used for harmonising wages and salaries in accordance with collective contracts, pensions, and social benefits. Also, it is used for deflating certain macroeconomic aggregates in national accounts statistics and for other purposes.

Consumer price index is defined as measure of average price change of fixed good and service basket bought by household for the purposes of satisfying its needs.

Weights used for calculating the consumer price index express a relative importance of selected products and services in total household consumption at the domestic territory.

Product list is regularly revised so that its representative status related to consumption structure and consumer habits is preserved.

Data are published according [Statistical Release Calendar](#).

The influence of certain groups on inflation rate indicates how much that group has influenced on the total inflation rate. The influence depends on weights and inflation rate of given group. The weights represents a relative share of household consumption of certain groups or subgroup of products in the total consumption. Consequently, weights have an important role in the calculation of inflation rate. They represent "importance" of certain product group in the total household consumption in certain reference period. For example, if during certain month prices of bread increases for 10%. this will influence for approx. 0.5% ($10 \cdot 5\% = 0.5\%$ - since the share of bread in the total expenses is 5%). But, if the prices of medicaments increase 12%, this will increase the inflation for 0.06% ($12 \cdot 0.5\% = 0.06\%$ - since the share of medicaments in the total expenses 0.5%). This simple example indicates how much large influence have weights on the final number presenting the inflation.

According to the [Revision policy](#) of the Statistical Office, the final data shall be published with the date defined by the Statistical Release Calendar.
