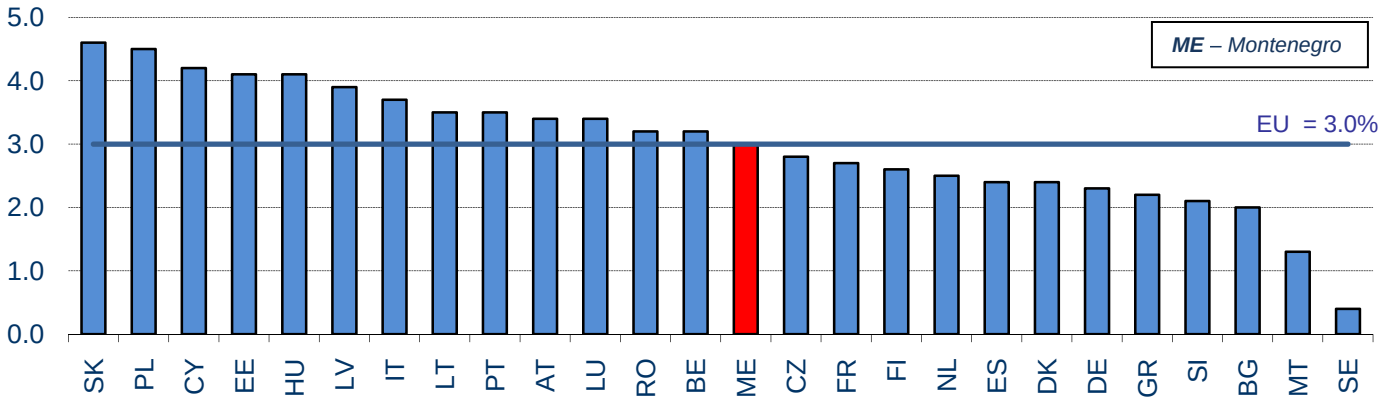
Diagram 2: Annual inflation rate measured by HICP, December 2011



Montenegro annual inflation was 3.0% in December 2011. EU annual inflation was 3.0% in December 2011, while there was 2.7% in the Euro area.

Harmonised Index of Consumer Prices (HICP) is the basis for comparative measurement of inflation in the European Union, and it estimates a monetary value in the Eurozone. As a difference to Consumer Index Index Price (CPI), it uses different methodological concept which is used by all EU members.

Dec 11 **month of the current year**
Ø 2010 **average (Ø) month of previous year**

This rate indicates a change in average prices in current month when compared with average prices in previous year.

Dec 11 **current month**
Nov 11 **previous month**

Monthly inflation rate (current month compared with previous month) measures a change of average prices of current months compared with average prices of previous month. Monthly inlfation rate can be under the influence of seasonal effects.

Dec 11 **month of the current year**
Dec 10 **the same month of previous year**

Annual inflation rate (month of the current year compared with the same month of previous year) measures a change in average prices in current month compared with average prices in the same month of previous year.

2011 **average of year 2011**
2010 **average of year 2010**

This rate indicates a change in average prices in year 2011 compared with average prices in 2010 year.

The influence of certain subgroups on inflation rate indicates how much that subgroup has influenced on the total inflation rate. The influence depends on weights and inflation rate of given subgroup. The weights represents a relative share of household consumption of certain groups or subgroup of products in the total consumption. Consequently, weights have an important role in the calculation of inflation rate. They represent "importance" of certain product group in the total household consumption in certain reference period. For example, if during certain month prices of bread increases for 10%, this will influence for approx. 0.5% (10*5%=0.5% - since the share of bread in the total expenses is 5%). But, if the prices of medicaments increase 12%, this will increase the inflation for 0.06% (12*0.5%=0.06% - since the share of medicaments in the total expenses 0.5%). This simple example indicates how much large influence have weights on the final number presenting the inflation.
