

## Harmonised Index of Consumer Prices (HICP) June 2017

**Monthly inflation in June 2017, measured by HICP was 0.6%**

Monthly inflation measured by Harmonised index of consumer prices was 0.6% in June 2017, while the annual inflation was 2.4%. This was influenced mostly by increase in prices of: accommodation services; catering services; fruit; meat; non-durable household goods, etc.

Observing the main groups monthly growth of prices was noticed in the following groups: Restaurants and hotels (4.4%); Housing, water, electricity, gas and other fuels (0.2%); Furnishing, household equipment and routine household maintenance (0.2%); Health (0.1%); Recreation and culture (0.1%), while a drop of prices was recorded in the following groups: Food and non-alcoholic beverages (-0.9%); Miscellaneous goods and service (-0.3%); Transport (-0.1%).

Prices of other products and services mostly remained unchanged.

Positive annual inflation rates in June 2017 were observed in the following groups: Restaurants and hotels (5.3%); Transport (3.6%); Alcoholic beverages and tobacco (3.5%); Health (2.9%); Clothing and footwear (2.4%); Housing, water, electricity, gas and other fuels (2.1%); Miscellaneous goods and service (1.9%); Food and non-alcoholic beverages (1.7%); Communications (0.1%), while negative annual inflation rates were observed in the following groups: Furnishing, household equipment and routine household maintenance (-1.2%); Recreation and culture (-0.2%).

**Chart 3. Annual inflation rate measured by HICP, May 2017**

**Euro area** annual inflation was 1.4% in May 2017, down from 1.9% in April 2017. **European Union** annual inflation was 1.6% in May 2017, down from 2.0% in April 2017.

## METODOLOGICAL NOTES

**Harmonised Index of Consumer Prices (HICP)** is the basis for comparative measurement of inflation in the European Union, and it estimates a monetary value in the Eurozone. As a difference to Consumer Index Price (CPI), it uses different methodological concept which is used by all EU members.

**Jun 2017 month of the current year**

**Ø 2015 average of base year**

This rate indicates a change in average prices in current month when compared with average prices in the base year.

**Jun 2017 month of the current year**

**May 2017 previous month of the current year**

**Monthly inflation rate** (current month compared with previous month) measures a change of average prices of current months compared with average prices of previous month. Monthly inflation rate can be under the influence of seasonal effects.

**Jun 2017 month of the current year**

**Jun 2016 the same month of previous year**

**Annual inflation rate** (month of the current year compared with the same month of previous year) measures a change in average prices in current month compared with average prices in the same month of previous year. In the presence of a stable seasonal pattern, seasonal effects do not influence this measure.

**Jun 2017 month of the current year**

**Dec 2016 December of the previous year**

This rate indicates a change in average prices in current month compared with average prices in December of the previous year. In December this rate is equal the annual inflation rate.

**The influence of certain groups on inflation rate** indicates how much that certain group has influenced on the total inflation rate. The influence depends on weights and inflation rate of given group. The weights represents a relative share of household consumption of certain groups or subgroup of products in the total consumption. Consequently, weights have an important role in the calculation of inflation rate. They represent "importance" of certain product group in the total household consumption in certain reference period. For example, if during certain month prices of bread increases for 10%, this will influence for approx. 0.5 percentage points ( $10 \times 5\% = 0.5$  percentage points - since the share of bread in the total expenses is 5%). But, if the prices of medicaments increase 12%, this will increase the inflation for 0.06 percentage points ( $12 \times 0.5\% = 0.06$  percentage points - since the share of medicaments in the total expenses 0.5%). This simple example indicates how much large influence have weights on the final number presenting the inflation. Summing up the influence in percentage points of all subgroups the final result should equal the all-items index rate of change in percentage.
